Abstract

ShareGo is a digital centralized baggage-sharing marketplace that connects travelers with unused luggage capacity to buyers demanding cheaper and efficient delivery of luggage within and across the borders. ShareGo provides an efficient, secure and cost-effective solution by resolving the problem of high courier fees, shipping costs and import taxes. It allows user to transport goods across borders by leveraging existing travel luggage space and also helps them to sell their unused luggage in thier destination area making travel easy and comfortable. Additionally, it also offers an AI chatbot to help travelers to inquire about their destination and a feature for local sales of unwanted items.

1. Introduction

Although global tourism and connectivity has increased with the advancement in technology but the movement of goods among the borders still remain complex and expensive as the customs law and duty structures varies from one country to another. Traditional courier methods are highly costly, time consuming and a great headache, especially for small parcels which require proper custom verification and high duty structures. Therefore, in todays world everyone wants the cheaper, fast, flexible and secure shipping. At the same time millions of people are travelling all over the world, and most of them have unused luggage space which remains unutilized.

ShareGo is created to fill that gap by creating a digital baggage-sharing marketplace which connects the traveler to the user searching for affordable and cheaper package movements. Also, sometimes travelers want to get rid of items which only add few kilograms to thier luggage and of no use. This problem is also resolved by allowing users to sell these unnecessary items locally. For example the traveler on the flight from China to USA may be requested to bring an electric fan, or a traveler can also sell his unused items in China before leaving creating space for the useful items.

Along with secure shipping an AI chatbot will also be integrated to enhance the travel experience with location based insights and shopping recommendations.

2. Goals and Objectives

Primary goal and objectives of our project are:

- Establishing a digital, centralized and secured platform for baggage-sharing and international deliveries.
- Utilization of unused luggage space by connecting travelers and buyers.
- Enable the traveler to sell out unnecessary items to make their journey easy and comfortable.
- Making the secure, cheaper and fast delivery and imports possible.
- Integration of AI chatbot to provide real time assistance to the user

3. Scope of the Project

The main motive behind the making of ShareGo platform is to create a secure centralized baggage-sharing marketplace which establishes the connection between the individuals looking for the cheaper, economical and fast domestic and across the border shipping operations with the travelers who have extra luggage space, making a suitable situation for both traveler and buyer. Customer will be able to search among the products listed by the traveler which are

useless for him and also allow buyer to request a specific item from the traveler traveling along a specific route.

This platform resolves the common issues international shipping which includes custom clearance, heavy duty structures and waiting delays by enabling travelers to utilize their luggage capacity at its maximum and earn extra money, while buyers gain from a decreased dependency on traditional courier services and lower import taxes, delivery time and headache.

Alongside facilitating baggage-sharing and item sale, ShareGo will introduce an AI-powered chatbot that will help travelers with destination insights, shopping advice and local recommendations. The integration of artificial intelligence will help to improve user experience and assists travelers in making well-informed decisions while traveling.

4. Initial Study and Work Done so Far

Marketplace research proves that the financial gains, convenience and enjoyable user experience play a major role in customer satisfaction, which earns user loyalty and forces him to retake your services [1]. The research on service sharing platforms also figured out that their success depends on effective coordination, trust and capacity to reach critical mass adoption [2]. These results are further supported by real world applications. Ride hailing platforms [4] and [5] have taken online service in transportation sharing through real time coordination and dynamic pricing. Whereas there are some platforms allowing travelers to carry goods internationally by utilizing extra and unused luggage space [3], also platforms are observed where individuals list their services and buyers purchase them [6] – in a similar way as the user on ShareGo will list their routes and luggage capacities and the consumer will select them according to their needs. The research proves that ShareGo can become one of its kind platforms that will provide local item selling, baggage sharing and AI assisted travel all under one roof making the user experience more joyful.
